

ICP / Audience definition

Who parks capital in a market-neutral vault — and why they need it on Canton.

Primary ICP — crypto-native treasuries, funds & DAOs

WHO	Trading firms, crypto funds, DAO/protocol treasuries and corporate crypto treasuries holding BTC, ETH or stablecoins (\$1M-\$100M idle).
PAIN	Their majors sit idle or earn “yield” that is really emissions, lending risk, or a hidden directional bet. Anything market-neutral today means an exchange sub-account nobody can audit.
WHY US	Structural, market-neutral funding carry (12.2% APY / 0.21% maxDD on 3.2y of real Hyperliquid data), with an on-ledger audit trail and NAV that only grows by realized funding.
WHO PAYS	Management + performance fee on realized NAV growth only; typical ticket \$1-10M per treasury.

Secondary ICP — regulated institutions entering via Canton

WHO	Funds, asset managers and corporates already on Canton rails (custody, tokenized assets) with mandates that require confidentiality AND auditability.
PAIN	A delta-neutral book on a transparent chain leaks every position and gets traded against; an off-chain book gives their auditor and LPs nothing to verify. Compliance kills the strategy on both paths.
WHY US	Canton's need-to-know disclosure resolves the trade-off: their auditor party sees every position live, counterparties see nothing, and role authority (custodian / manager / auditor / holder) is enforced by the ledger, not by policy.
WHO PAYS	Same fee structure at institutional size; they also bring their own auditor party — the feature IS the compliance story.

Tertiary — Canton builders composing the vault

Wallets, treasuries-as-a-service and RWA platforms on Canton that want a yield leg: vault shares are transferable Daml holdings, so any Canton app can offer “earn” by composing against the vault as a primitive. They distribute; the vault pays a referral share of fees.

design partners for testnet pilot

How we reach them

Start where the mechanism already has proof: basisyield.com's existing audience of funding-carry users. Then Canton-native channels — custody and asset-issuer partners (BitSafe, OnRails), the Canton App Marketplace, and 1-2 named design-partner treasuries for the testnet pilot, each onboarded with their own auditor party so the privacy claim is proven on their books, not ours.
