

Go-to-market

Distribution-first: we start with an audience that already exists and fees that only bite on realized yield.

The plan — three phases, each self-funding the next

NOW · 0–2 MO**Prove it with design partners (testnet)**

Two named fund/DAO treasuries onboard on Canton testnet with their own auditor party — real cBTC/cETH long leg via CIP-56, short leg on the production engine in paper mode. Zero fees; the deliverable is their auditor saying “I can see everything” while the market sees nothing.

2–5 MO**First live capital, fee-free early cohort**

Arm the Hyperliquid short with the production execution stack (agent key, leg-sync, killswitch). \$5–20M target AUM from the design partners + basisyield.com waitlist. Publish live NAV next to the backtest — realized numbers become the marketing.

5–9 MO**Fee switch + composability distribution**

Management + performance fee on realized NAV growth only. Open the vault as a Daml primitive: Canton wallets and RWA platforms embed “earn” against it for a referral share — every integration is a distribution channel we don't pay for upfront. Add the gold pair (DBS) and T-bill margin as they ship.

Channels — in order of cost-effectiveness

1 · basisyield.com — the mechanism's existing audience and waitlist; the Canton vault is the custody-grade upgrade they've asked for. 2 · Ecosystem partners — BitSafe (cBTC) and OnRails (cETH) need flagship apps that make their assets productive; co-marketing is mutual. 3 · Canton-native surfaces — App Marketplace listing, network-reward leaderboards, GSF/Canton community channels. 4 · DAO treasury governance — public forum proposals put the vault in front of every tokenholder; one accepted proposal is both AUM and a public case study. 5 · Auditor-led institutional intros — the observer party demo is the meeting we ask custody partners to book.

channels 1–2 are already ours

Why we win the segment

Provenance: the engine already runs 24/7 in production — competitors start from a whitepaper. Honesty as brand: ranges instead of cherry-picked APYs, realized-only NAV, a public “what we don't claim” list — the trust posture institutions actually diligence. Structural moat on Canton: privacy-viable delta-neutral books and (next phase) yield-bearing RWA margin are things no transparent chain or crypto venue can copy.

Supporting materials

Live demo: canton.basisyield.com (click the 6-step lifecycle — real Daml txs, role switch). Repo: github.com/talkinandy/basisvault (backtests reproducible, 7 Daml scripts + 38 tests). One-pagers: value/problem, ICP, metrics/validation (this pack). Production site: basisyield.com (mechanism explainer, honesty rules). Demo video: submission form.
